Goldstein Classical Mechanics 2nd Edition

This book is the Bible of Classical Mechanics. I still recognize new relations in this topic whenever I start to read it. Second Edition is a legendary version of this book like Red-Jackson (Classical Electrodynamics). As a lecturer, I think Goldstein's book is an indispensable course material prepared for who learn classical mechanics.

Goldstein 2nd Edition Problem 2-20
Length of second spring $\ll r_0$ m can be considered to be at the end of first string
 $T_e = mv^2 = me^2 r^2 = me^2 (r_0 + x_1)^2$
(a) $T = me^2 (r_0 + x_1)^2 + m + m$ where in the last term we have again approximated because $x^2 \ll r_0$
 $V = Kx_1^2 + kx_2^2$ The first two terms are conserved, but energy E is not conserved because the last term varies; this is because of the power expended in keeping e constant.

In the second edition, Goldstein
corrected all the errors that had been
pointed out, added a new chapter on
perturbation theory, a new section on
Bertrand's theorem, and another on
Noether's theorem. Other arguments
and proofs were simplified and
supplemented.

Content: 4 stars. Quality of the edition: zero stars (worse than "I hate it"), giving an average of two stars. I also owe the magnificent second edition by Addison-Wesley, of a great work by Goldstein.

ABOUT CONTENT: compared to the second edition, the third edition added about one section per chapter, but not all chapters were added sections.
