The Internal Combustion Engine is an engine in which the combustion of a fuel (generally, fossil fuel) occurs with an oxidizer (usually air) in a combustion chamber. In an internal combustion engine the expansion of the high temperature and pressure gases, which are produced by the combustion, directly applies force to a movable component of the engine, such as the pistons or turbine blades and by moving it over a distance, generate useful mechanical energy.

### Internal combustion engine - Wikipedia

The principle of working of both SI and CI engines are almost the same except the process of the fuel combustion. In SI engines, the burning of fuel occurs by a spark generated by the spark plug. In CI engines the burning of the fuel occurs due to compression of the fuel to excessively high pressures which does not require any spark.

An Internal Combustion Engine (IC engine) is a heat engine where the combustion of a fuel occurs with an oxidizer in a combustion chamber that is an integral part of the working fluid flow circuit. Basically in an engine, the chemical energy is transformed into heat energy by the combustion of the fuel and that heat energy is transformed into mechanical work which is used to perform work.

Internal combustion engines are devices that generate work using the products of combustion as the working fluid rather than as a heat transfer medium. To produce work, the combustion is carried out in a manner that produces high-pressure combustion products that can be expanded through a turbine or piston.
