### Mmc Drawing Value Mmc

Maximum Material Condition or for short, MMC, is a feature of size symbol that describes the condition of a feature or part where the maximum amount of material (volume/size) exists within its dimensional tolerance. The callout also removes GD&T Rule#2 which states that all geometry tolerances are controlled independently of the feature size.

The MMC and LMC symbols are, respectively, the letter M or L inside of a circle. An example use of the MMC symbol is shown below. The boxed symbols can be read "the position of these two holes may vary within a cylindrical tolerance zone of 0.1 relative to datums A, B, and C when the holes are at their maximum material condition".

And at 10.2 it will be in MMC. Example of Bonus Tolerance. Say, you have a drawing of a block with a hole like below: Observe the GD&T control frame. The meaning of the GD&T symbol is: "a positional tolerance of 0.2 is applicable to the hole when it is at the maximum material condition (MMC)".

### How To Calculate Mmc For Hole Position Tolerance ...

The MMC size of a feature is not to be confused with the MMC modifier, circle M. As the actual mating envelope size of the feature departs from MMC toward LMC, a bonus tolerance is achieved in the exact amount of such departure. Bonus tolerance equals the difference between the actual mating envelope and the MMC sizes of a feature.

### Specifying the Position Tolerance at MMC

Pin diameter at MMC= 25. Bonus Tolerance = 0. Position tolerance at MMC = 5. The concept of MMC and bonus tolerance becomes much clearer if visualized in 3D. In this first video, the center axis of the cylinder representing the pin at MMC displaces around the position tolerance zone, which is defined as a cylinder with a diameter of 5mm.

### GD&T for beginners: MMC & bonus tolerance, explained in 3D

At MMC the maximum clearance available between the gauge and the hole is 0.2, so available tolerance at MMC is 0.2. Now as per the given dimension the hole diameter can vary from 10.2 to 10.5, and as the hole size increase the tolerance available between the gauge and the hole also increases. At MMC the maximum available tolerance will be equal to

### Geometric Dimensioning and Tolerancing Bonus Tolerance ...

The Modifiers (MMC,LMC,RFS) are used to clarify implied tolerances. There are three directly implied modifiers to the tolerance value. These are;1-) Regardless of Feature Size (RFS)2-) Maximum Material Condition (MMC)3-) Least Material Condition (LMC)The symbols for them can be found in the previous chart.

MMC symbol next to a Datum (must be a feature of size also) = something completely different: it means you get to shift the tolerance zone over by the amount the Datum is over it's smallest allowed size. Only Xactmeasure can perform this in-dimension-alignment-shift, Legacy does it wrong.

### MMC on Datum: What does this mean? - PC-DMIS User Forum

Engineering Drawing MMC is that condition of a part or feature which contains the maximum amount of material, e.g. minimum size hole, or a maximum size shaft. In certain cases its use allows an increase in the specified tolerance if it is indicated that the tolerance applies to the feature at its maximum material condition.

Attached is a drawing for this question; my understanding is if we convert the (blue) geometric tolerance of position 0.014 @MMC for the hole pattern to a "0" positional tolerance at MMC (in pink) the end result is: instead of the hole pattern having a cylindrical positional tolerance zone of 0.014 @MMC, available bonus of 0.026 (as the part goes from MMC to LMC) and hole size dimension of 0.764-0.790; the axes of the hole pattern must now be right on when at MMC but we gain additional 0.14 ...

MMC of this shaft is 20.02 And LMC is 19.8 But. The mmc and lmc of hole is different. If you consider a hallow cylinder of inner diameter 10mm, with tolerance 0.2mm (i.e.: 10+-0.2) Here mmc of shaft is 9.8mm Lmc is 10.2mm. Think physically a little bit. If the diameter of hole increases. That means the material is removed.
