MongoDB is a document database that stores records as loosely structured documents. That might be perfect for storing web pages as documents, for an e-Commerce product catalog, or social network applications. Like Redis, MongoDB differs from relational models in that it does not strive for ACID compliance. See also, "Database Deep Dives ...

Document databases were originally designed so store documents. If you use them for other data, you are not going to get the best performance/usage just the same as if you store documents in a relational databases. This happens a lot. People store relational data in document databases and then complain how bad document databases are.
