### Robust Control Of Inverted Pendulum

A robust balancing controller for flexible inverted-pendulum systems is proposed. Design guidelines to enhance the robustness to disturbances are outlined. A flexible pendulum-on-cart and its rigid-link counterpart are compared.

The inverted pendulum is a system that has a cart which is programmed to balance a pendulum as shown by a basic block diagram in Figure 1. This system is adherently instable since even the slightest disturbance would cause the pendulum to start falling. Thus some sort of control is necessary to maintain a balanced pendulum.

We need to keep the pendulum upright while moving the cart to a new position or when the pendulum is nudged forward (impulse disturbance ). Control Structure. The upright position is an unstable equilibrium for the inverted pendulum. The unstable nature of the plant makes the control task more challenging.

The robust generalized dynamic inversion control is designed in two stages; in the first stage, constraint differential equations of the controlled state variables are prescribed, which encompasses the control objectives. To enforce the constraint dynamics, the equivalent control is realized by means of Moore-Penrose generalized inversion.
